

The diagram illustrates a process flow with two main feed streams, PDC-01 and CAL-01, entering a system. PDC-01 (top left) and CAL-01 (bottom left) are represented by rectangular boxes with internal symbols. The flow from PDC-01 passes through a valve and a pump (VR-01) before entering a large vertical separator. The flow from CAL-01 passes through a valve and a pump (VCR-01) before entering the same separator. The separator has two outlets: a top outlet leading to a pump (CIR-01) and a bottom outlet leading to a pump (VOL-01). The top outlet of the separator feeds into a pump (VE-01), which then feeds into a pump (AF-02). The bottom outlet of the separator feeds into a pump (AF-01), which then feeds into a pump (ACS-01). The flow from the top outlet of the separator also passes through a pump (VR-02) before entering a pump (VD-01). The flow from the bottom outlet of the separator also passes through a pump (VD-01). The flow from the top outlet of the separator also passes through a pump (VR-01) before entering a pump (RAD-01). The flow from the bottom outlet of the separator also passes through a pump (VR-01) before entering a pump (RAD-01). The flow from the top outlet of the separator also passes through a pump (VR-01) before entering a pump (RAD-01). The flow from the bottom outlet of the separator also passes through a pump (VR-01) before entering a pump (RAD-01).
