

The diagram illustrates a three-stage process, likely a distillation or separation column, with three parallel processing units labeled PDC-01, PDC-02, and PDC-03. Each unit is represented by a rectangular box containing a circular symbol with three radial lines, and a vertical stack of five horizontal lines. The flow paths are color-coded: red for the top product stream and blue for the bottom product stream.

- Top Product Stream (Red):**
 - From each PDC unit, a red line leads to a valve, followed by a vertical riser pipe. The riser pipe for PDC-01 and PDC-02 is labeled $\varnothing i 40$, while the riser for PDC-03 is labeled $\varnothing i 50$.
 - The risers for PDC-01 and PDC-02 are connected to a common horizontal header pipe labeled $\varnothing i 50$.
 - The riser for PDC-03 is connected to a separate horizontal header pipe labeled $\varnothing i 40$.
 - Each riser also has a side connection to a vertical pipe labeled $\varnothing i 40$, which is equipped with a temperature sensor (T) and a pressure sensor (P).
- Bottom Product Stream (Blue):**
 - From each PDC unit, a blue line leads to a valve, followed by a vertical riser pipe. The riser for PDC-01 and PDC-02 is labeled $\varnothing i 40$, while the riser for PDC-03 is labeled $\varnothing i 50$.
 - The risers for PDC-01 and PDC-02 are connected to a common horizontal header pipe labeled $\varnothing i 50$.
 - The riser for PDC-03 is connected to a separate horizontal header pipe labeled $\varnothing i 40$.
 - Each riser also has a side connection to a vertical pipe labeled $\varnothing i 40$, which is equipped with a temperature sensor (T) and a pressure sensor (P).
